# Bandwidth Parasites

- BitTorrent is leaching Tor's capacity!
- Throttle BitTorrent
  - Improve client performance
  - Support more users → improve anonymity

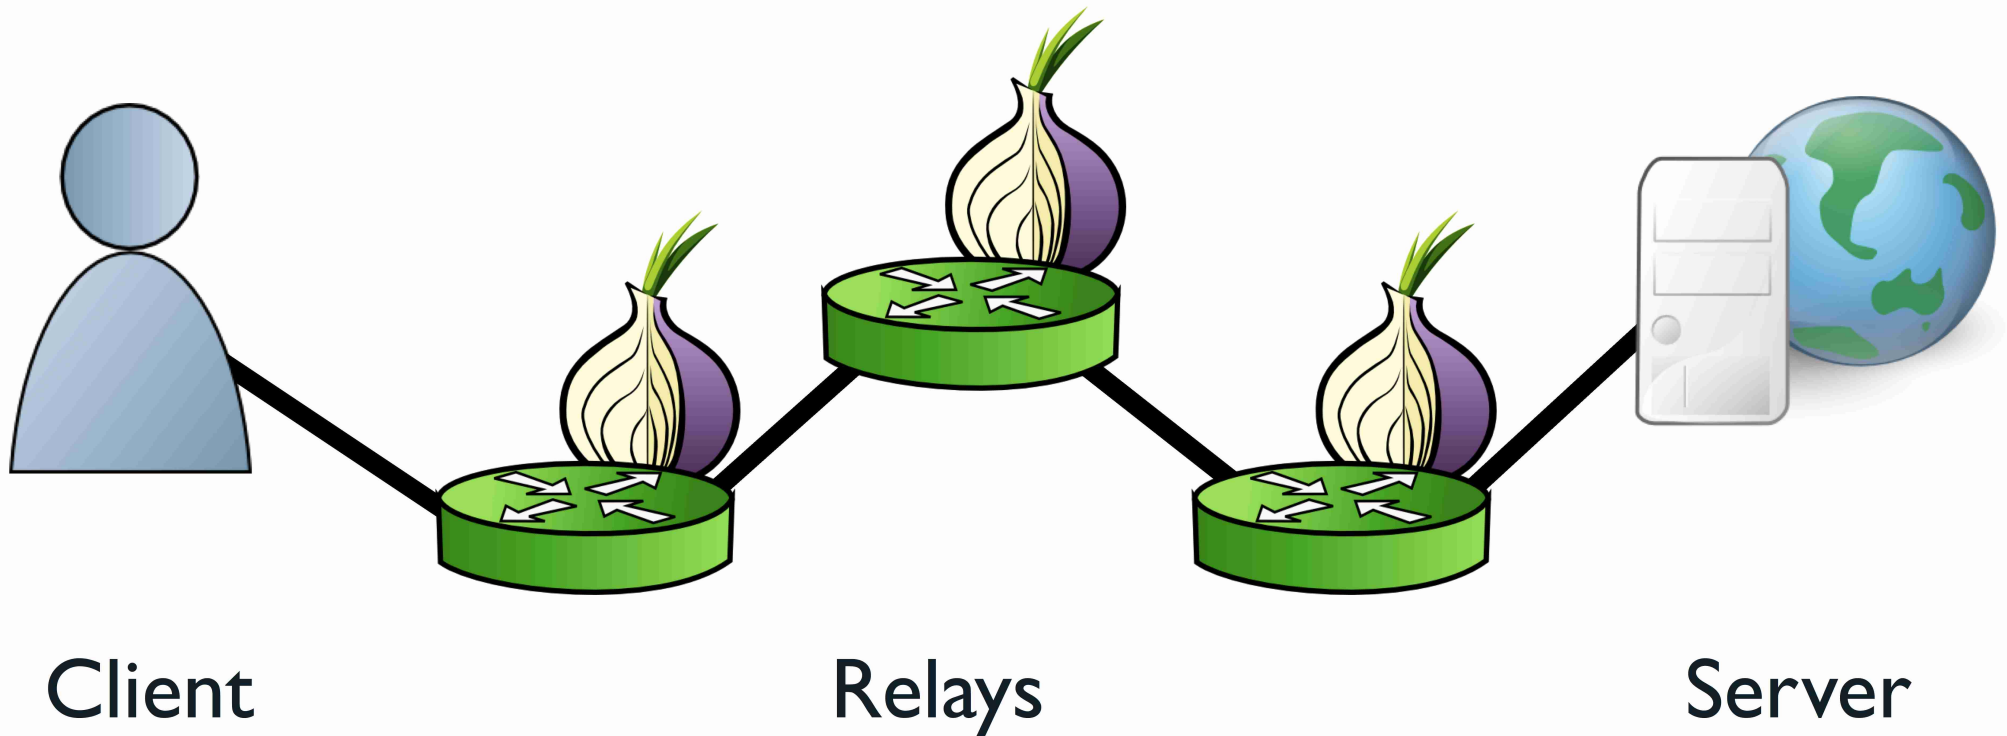

# Outline

- Problem and Motivation
- More Tor Details
  - Circuits, Guards, Multiplexing
  - “Static Throttling”
- Adaptive Throttling
- Performance Evaluation
- Anonymity Evaluation

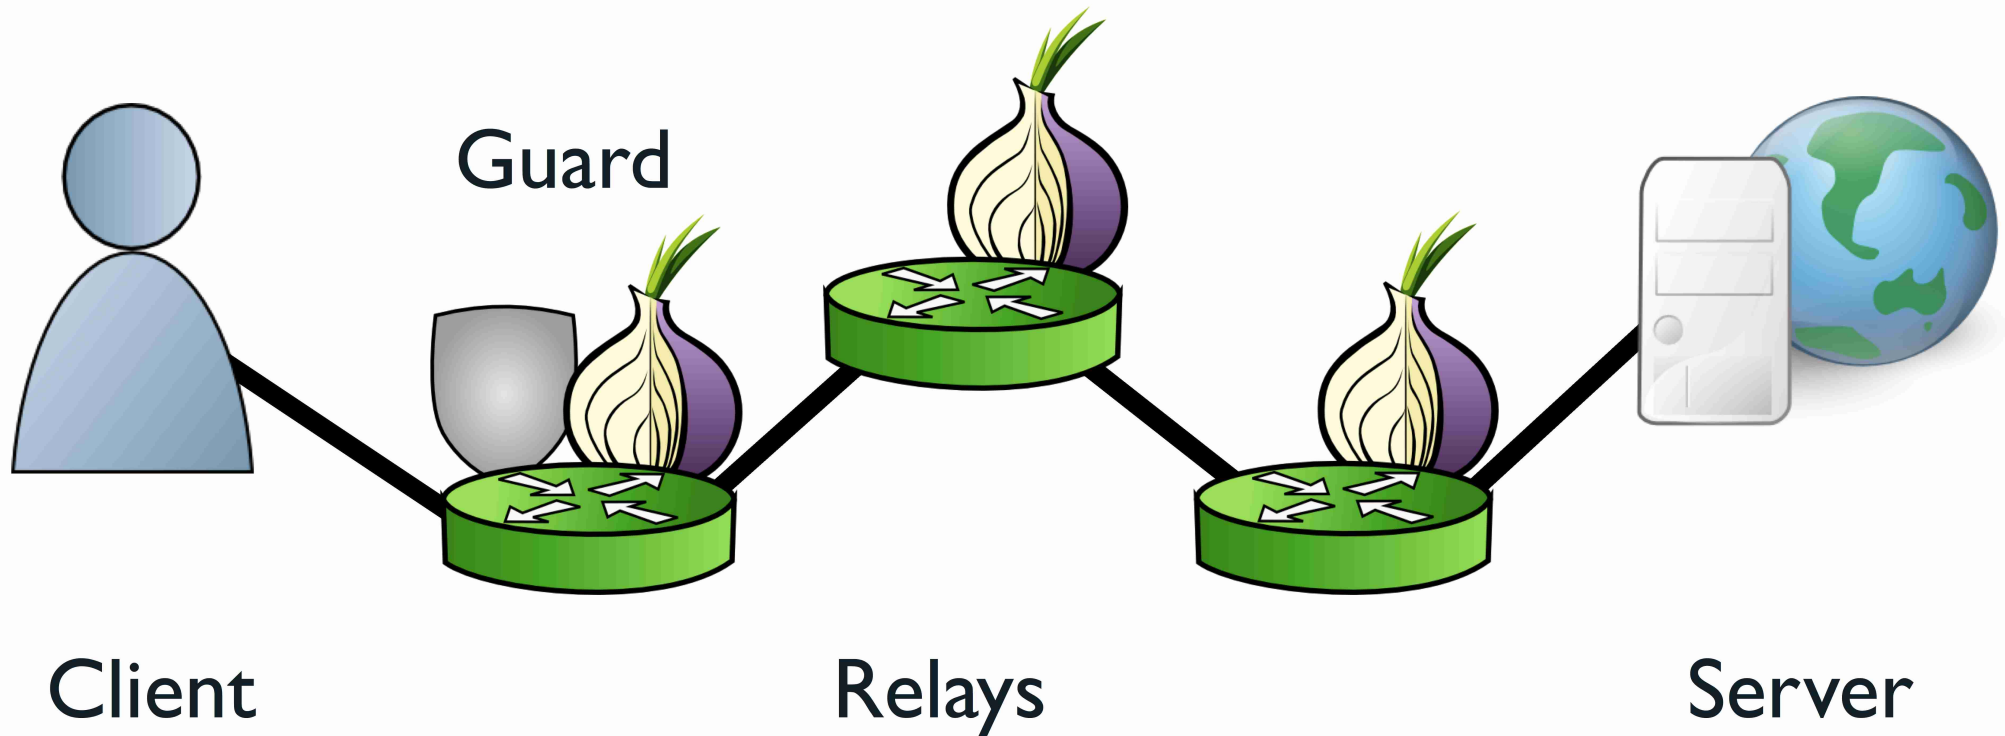

# Anonymity with Tor

# Multiplexing Circuits

# “Statically” Throttling Clients

# Outline

- Problem and Motivation
- More Tor Details
  - Circuits, Guards, Multiplexing
  - “Static Throttling”
- **Adaptive Throttling**
- Performance Evaluation
- Anonymity Evaluation

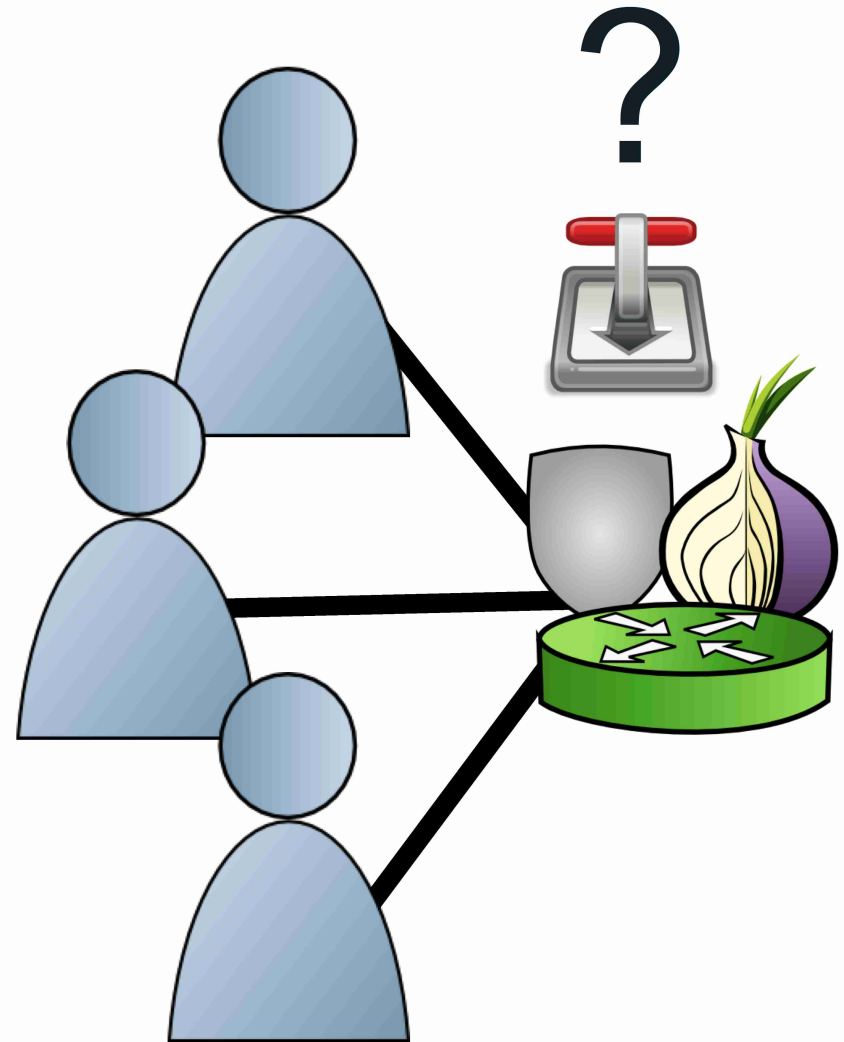

# Throttling Algorithms

## → Criteria:

- Which connections?
- At what rate?

## → Constraints:

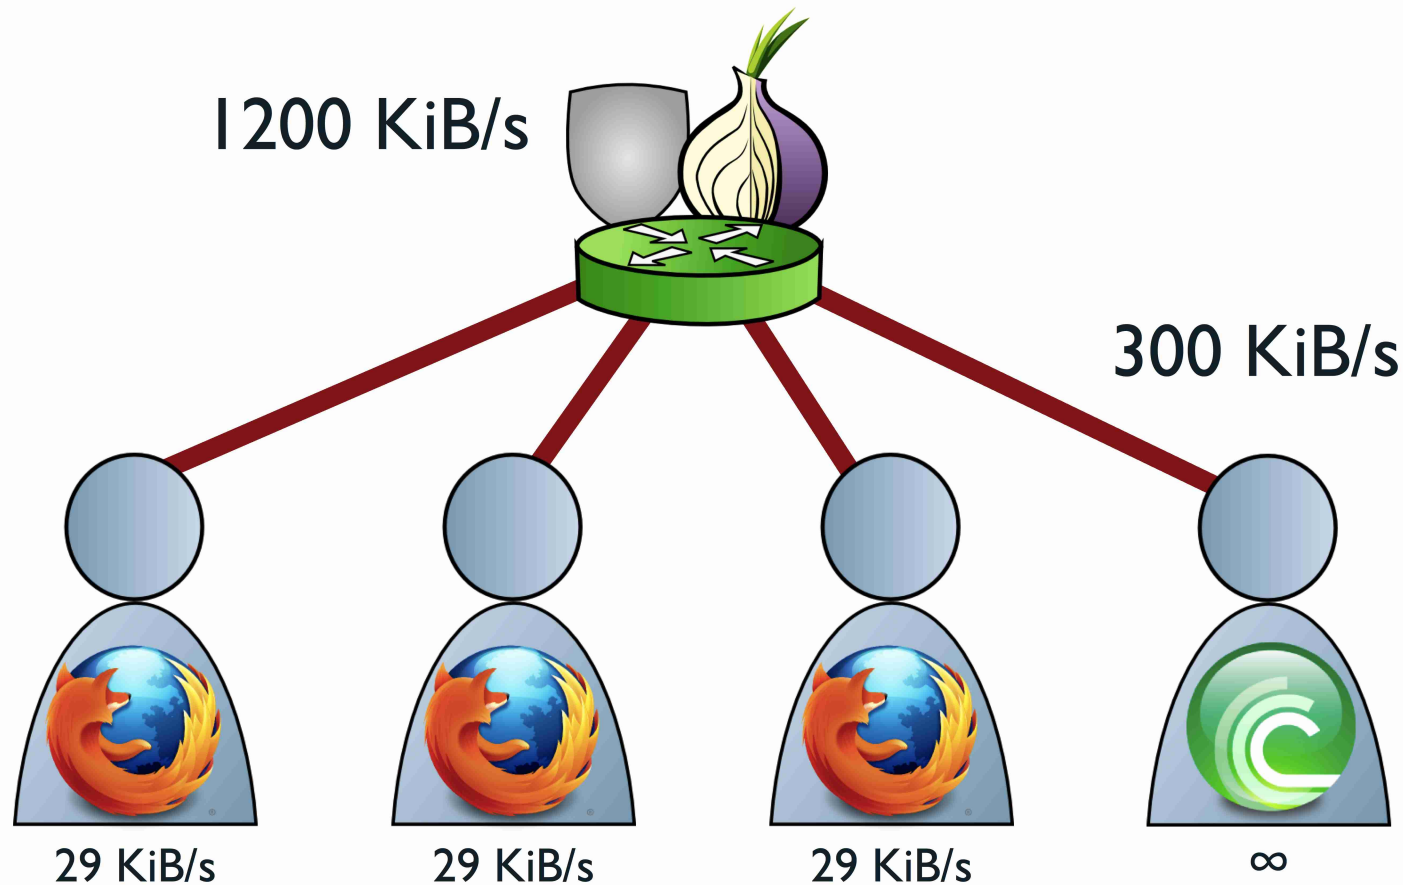

- Use only local information
- Unsupervised

# Our Approaches: Bit-splitting

→ Adaptively adjust *throttle rate*

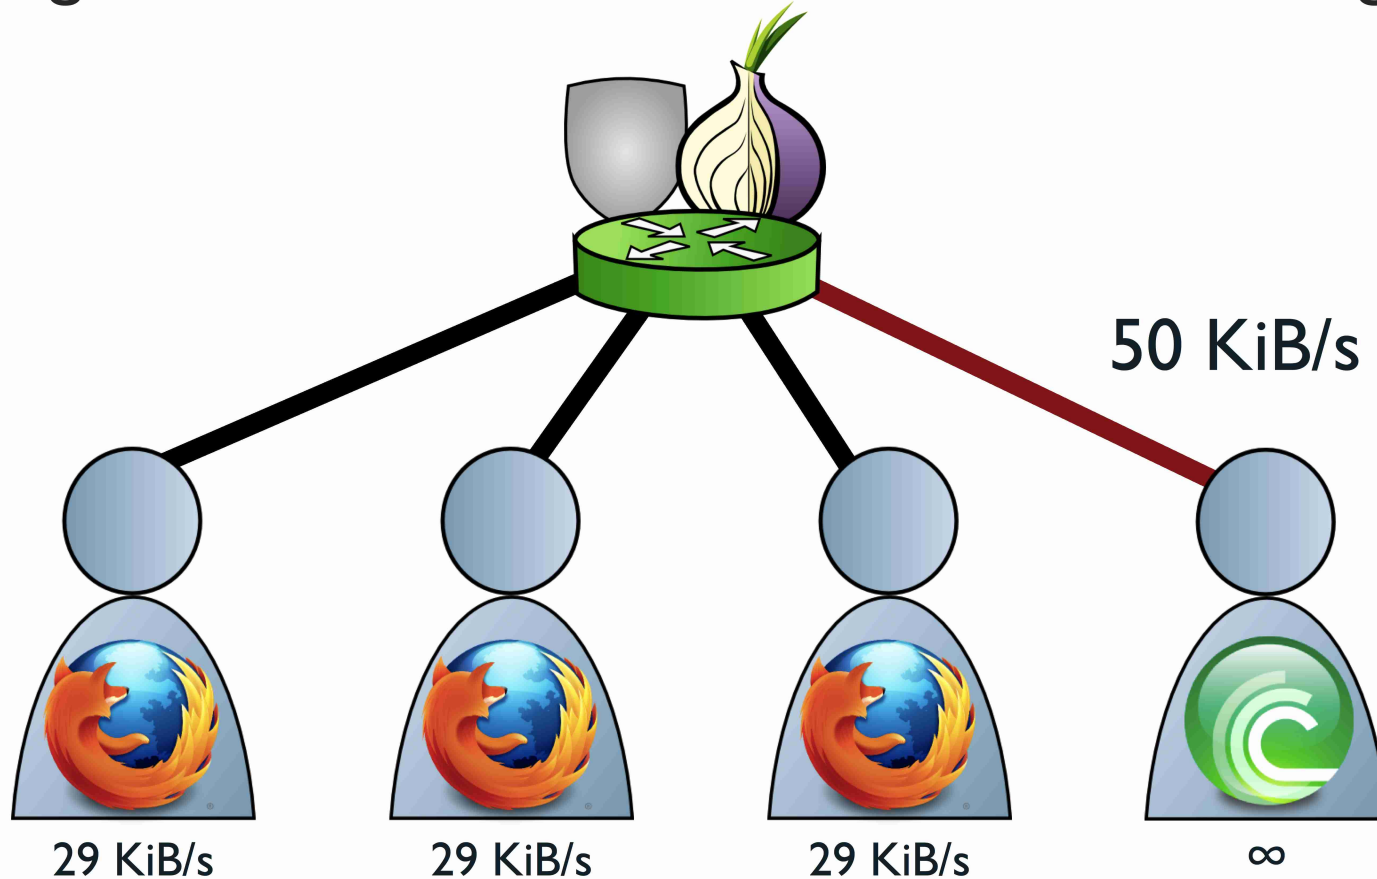

- Each client allocated fair bandwidth share

# Our Approaches: Flagging

→ Adaptively select *connections*

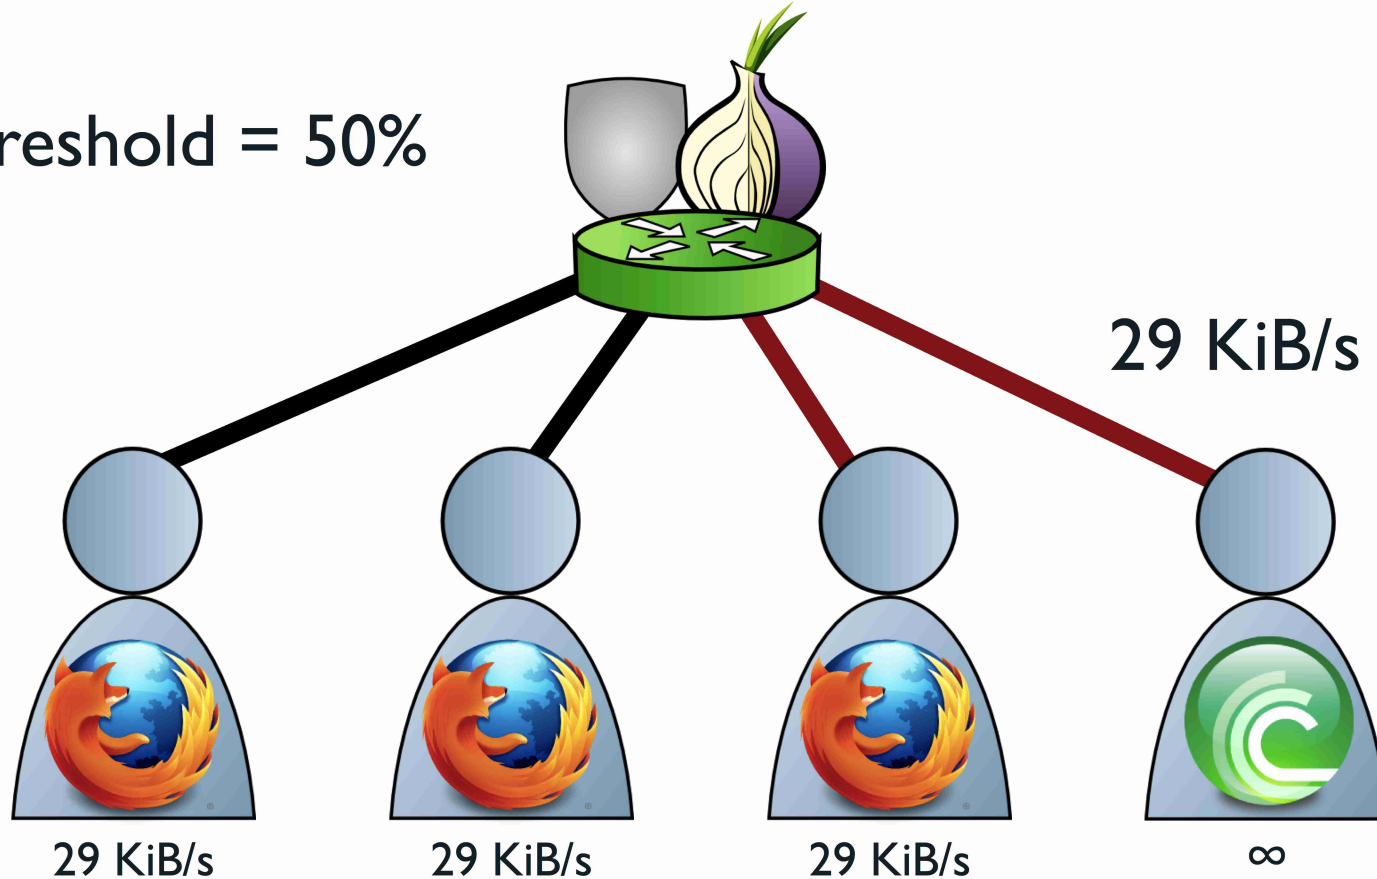

- Flag connections that use too much, throttle aggressively

# Our Approaches: Threshold

- Adjust both *throttle rate* and selected *connections*
  - Threshold: throttle the loudest connections

Threshold = 50%

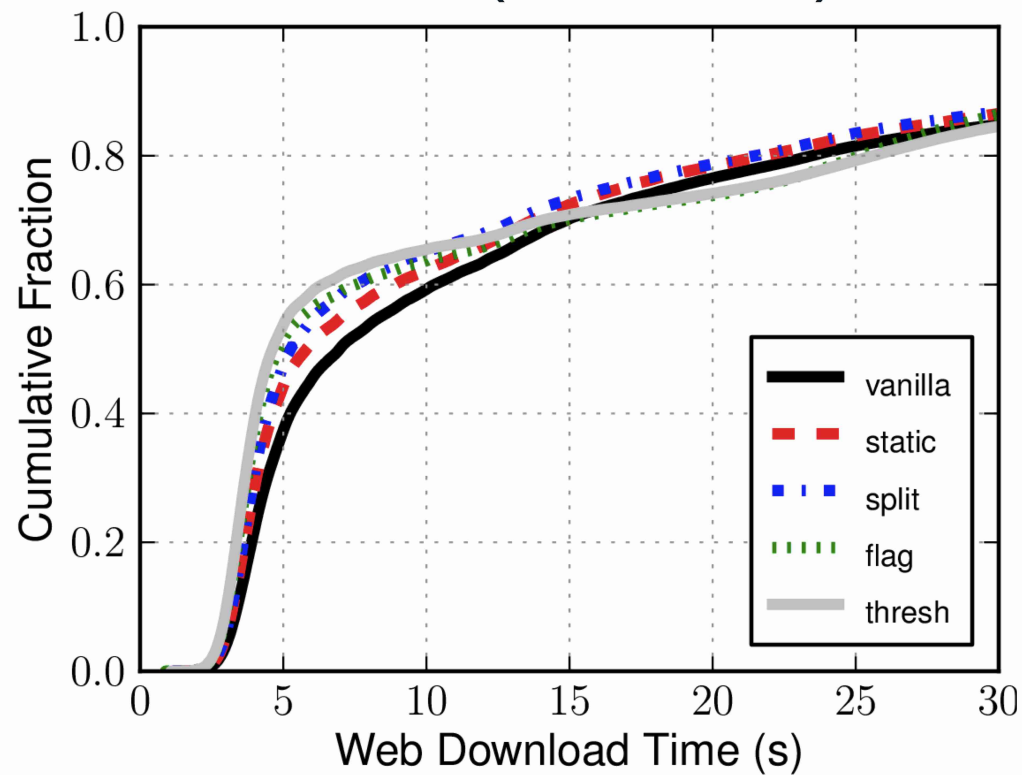

# Outline

5 KiB/s

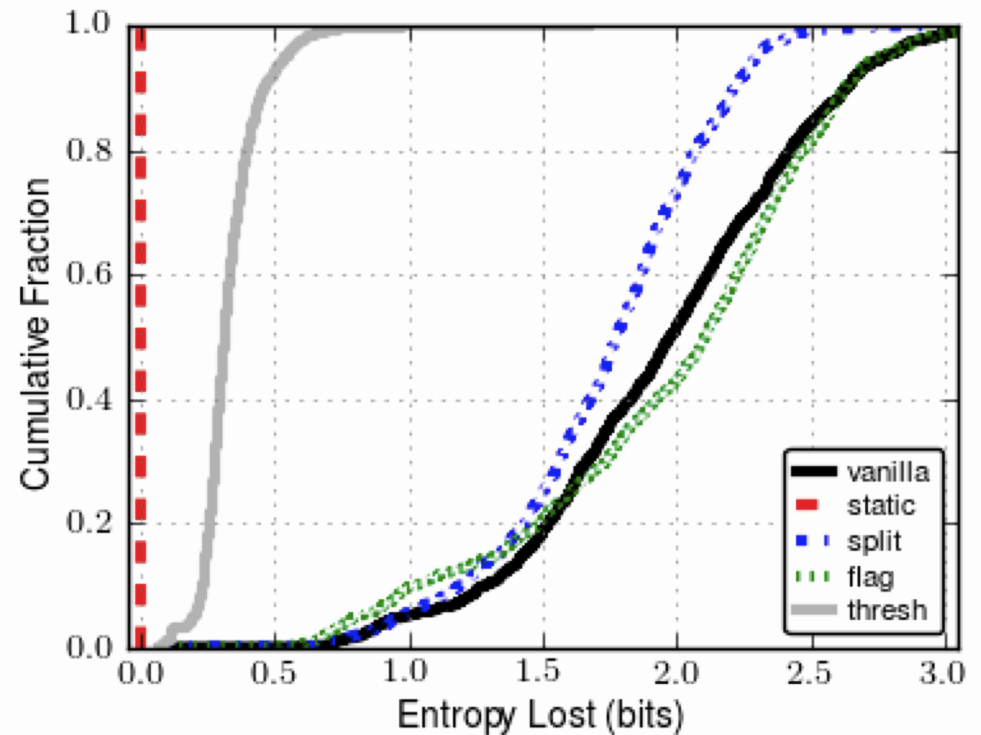

# Anonymity Results

## Learn Circuit Throughput

## Learn Throttle Rate

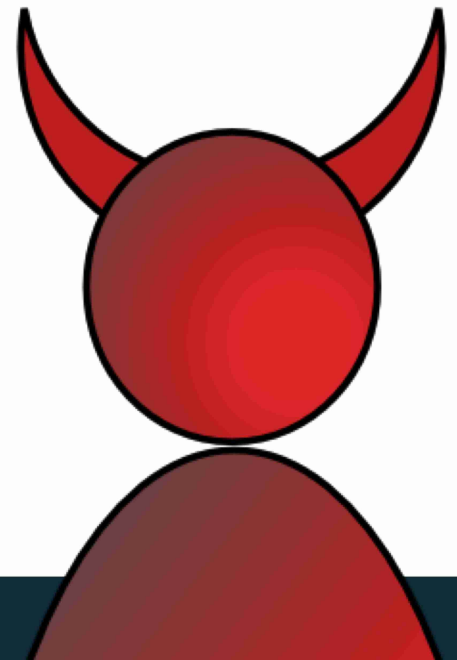

# Conclusions

- Goal: throttle bandwidth parasites
  - Throttling improves web client performance, anonymity
  - Tor patches publicly available
- Open question:
  - How to deal with 'cheaters'?
