Prior field work on warning messages  
to discourage risky behavior

Little field work on messaging to  
encourage secure behavior

# Research goal: Identify messaging principles to improve 2FA adoption

RQ1: Does messaging tailored to address:

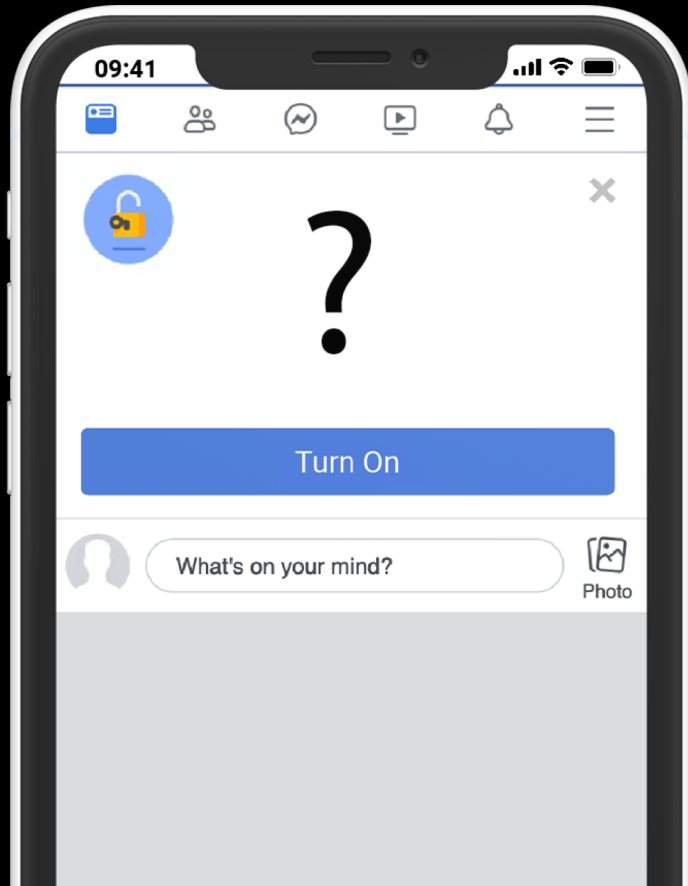

- Motivations
- Mental models
- Concerns

improve 2FA adoption?

RQ2: Does applying UX design patterns from other domains work for adoption of 2FA?

# We conducted a series of controlled field experiments on Facebook's 2FA prompts

## Participants:

- Did not already have 2FA enabled
- Representative sample of U.S. Facebook users
- Selected by standard FB product experiment protocols

## Metric of Interest:

- Click-to-enable (CTE): clicks to enable 2FA; correlated with actual 2FA enroll ( $r=0.744$ ,  $p<0.001$ )

# Our first experiment addresses RQ1 by varying 2FA prompt headline & body text

3 X 3 experimental design testing theory from prior work

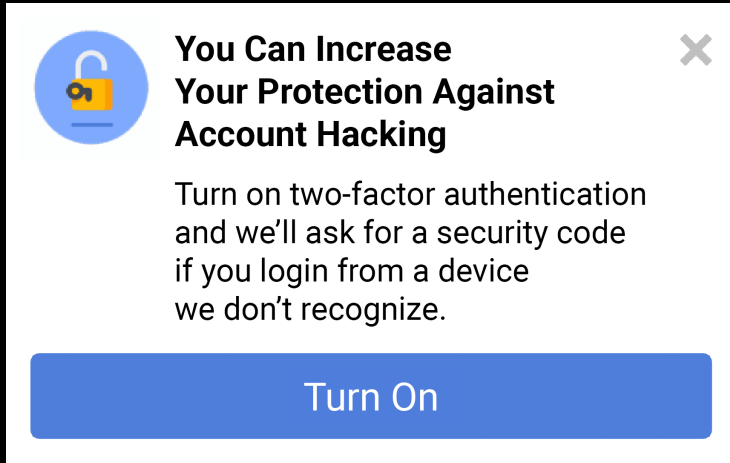

Average of 71,700 users per prompt (SD = 375.3)

Headline	Basis
<b>User Responsibility:</b> “You can increase your protection against account hacking”	Protection motivation theory
<b>Company Responsibility:</b> “Your security is our responsibility”	Stanton et al. 2016 Redmiles 2019
Control (Responsibility-Neutral): “Protect your account, pages, and friends”	

X

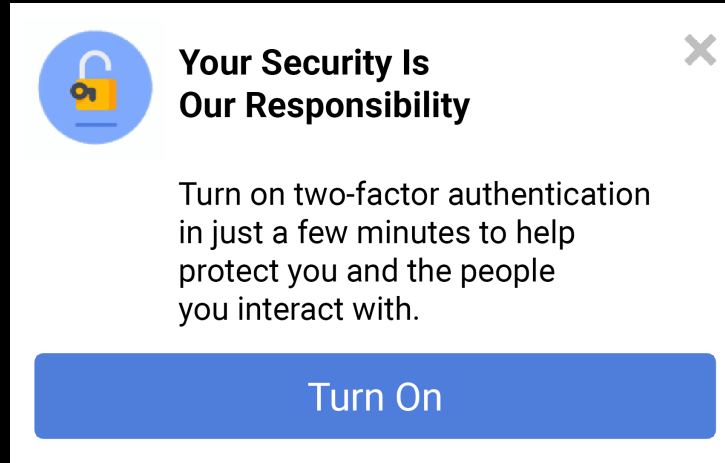

Body	Basis
<b>Time Costs:</b> “Turn on two-factor authentication in just a few minutes to help protect you and the people you interact with”	Herley 2009 Colnago et al. 2018 Redmiles et al. 2017 Redmiles et al. 2018
<b>Mental Model:</b> “Turn on two-factor authentication and we’ll ask for a code if we see a login from a device we don’t recognize”	Colnago et al. 2018 Redmiles et al. 2017
Control (Responsibility-Neutral): “Turn on two-factor authentication to increase protection for you and the people you interact with”	

# Examples of experimental prompts shown at the top of participants' Facebook newsfeeds

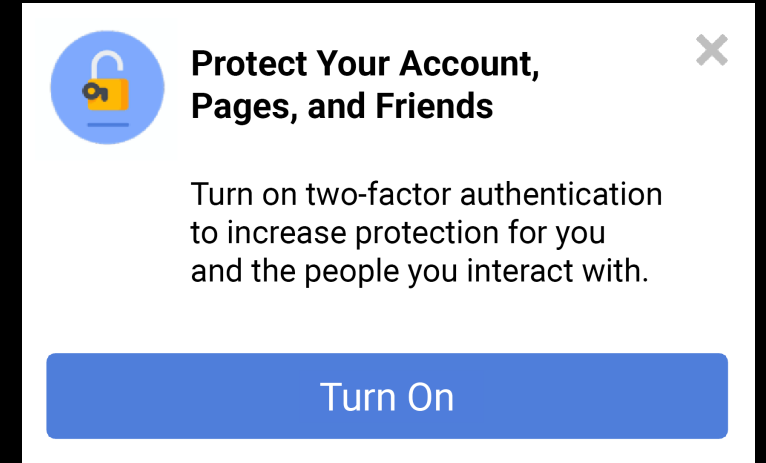

This prompt features a blue circular icon with a yellow padlock and a keyhole. The headline is "You Can Increase Your Protection Against Account Hacking" in bold black text. The body text reads: "Turn on two-factor authentication and we'll ask for a security code if you login from a device we don't recognize." At the bottom is a blue button with the text "Turn On". A small grey 'X' icon is in the top right corner.

**Headline:** User Responsibility  
**Body:** Mental Model

This prompt features a blue circular icon with a yellow padlock and a keyhole. The headline is "Your Security Is Our Responsibility" in bold black text. The body text reads: "Turn on two-factor authentication in just a few minutes to help protect you and the people you interact with." At the bottom is a blue button with the text "Turn On". A small grey 'X' icon is in the top right corner.

**Headline:** Company Responsibility  
**Body:** Time Costs

This prompt features a blue circular icon with a yellow padlock and a keyhole. The headline is "Protect Your Account, Pages, and Friends" in bold black text. The body text reads: "Turn on two-factor authentication to increase protection for you and the people you interact with." At the bottom is a blue button with the text "Turn On". A small grey 'X' icon is in the top right corner.

**Headline:** Control  
**Body:** Control

# Most effective messaging emphasizes user responsibility + informs users' mental models

Compared to the **control headline** those shown the:

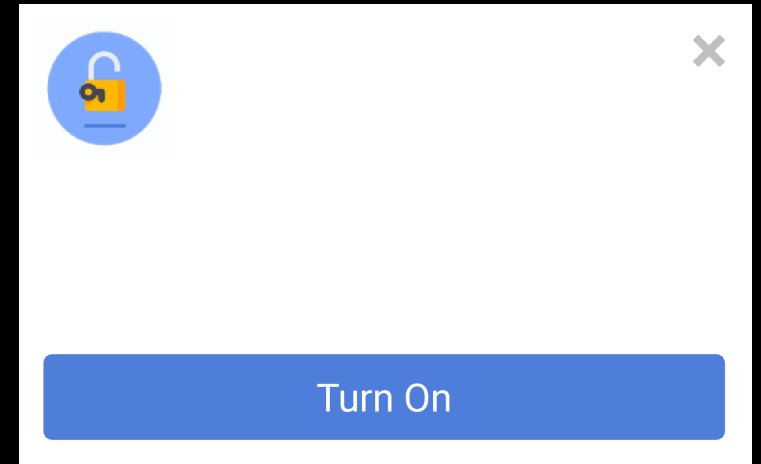

**User responsibility** headline were 33% more likely to click to enable 2FA (95% CI: 22% - 45%)

**Corporate responsibility** headline did not have a significantly different CTE rate

Compared to the **control body text** those shown the:

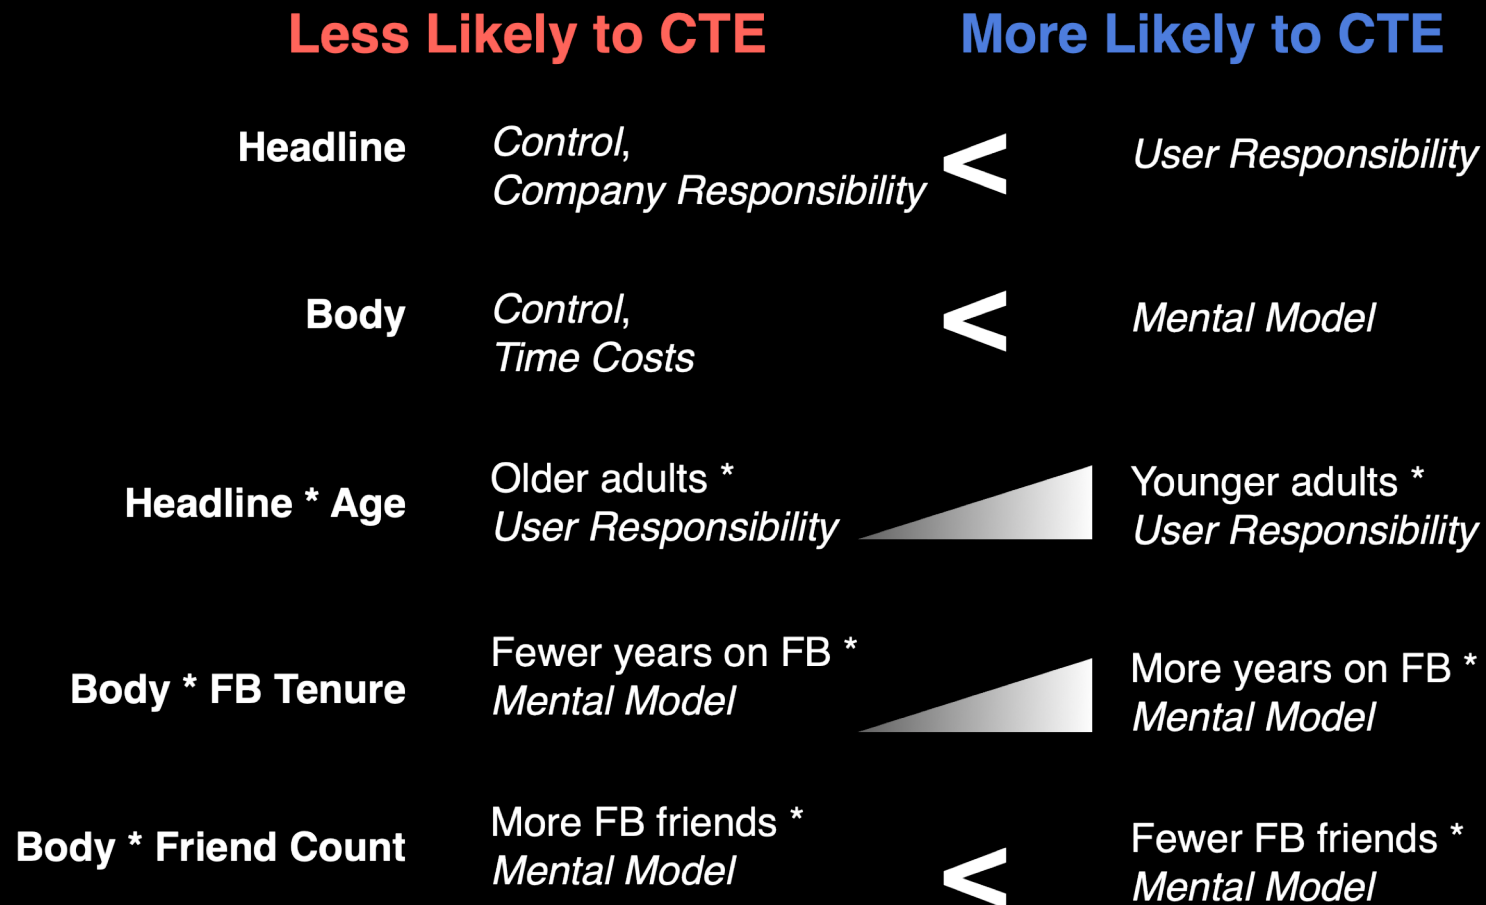

**Mental Model** body text were 28% more likely to click to enable 2FA (95% CI: 17% - 39%)

**Time Costs** body text did not have a significantly different CTE rate

Best Performing Message

# Controlling for demographics, user responsibility + mental model messaging remains most effective but efficacy varies with age & FB Use

Results of a logistic regression model predicting whether a given user clicked to enable (CTE) 2FA on the prompt they were shown.

# Messaging is not the only thing that influences 2FA enablement; demographics matter too

*Results of a logistic regression model predicting whether a given user clicked to enable (CTE) 2FA on the prompt they were shown.*

# Research goal: Identify messaging principles to improve 2FA adoption

RQ1: Does messaging tailored to address:

- Motivations
- Mental models
- Concerns

improve 2FA adoption?

# Research goal: Identify messaging principles to improve 2FA adoption

RQ1: Does messaging tailored to address:

- Motivations
- Mental models
- Concerns

improve 2FA adoption?

RQ2: Does applying UX design patterns from other domains work for adoption of 2FA?

# Our second set of experiments addresses RQ2 by testing three UX techniques from other domains

RQ1: Does messaging tailored to address:

- Motivations
- Mental models
- Concerns

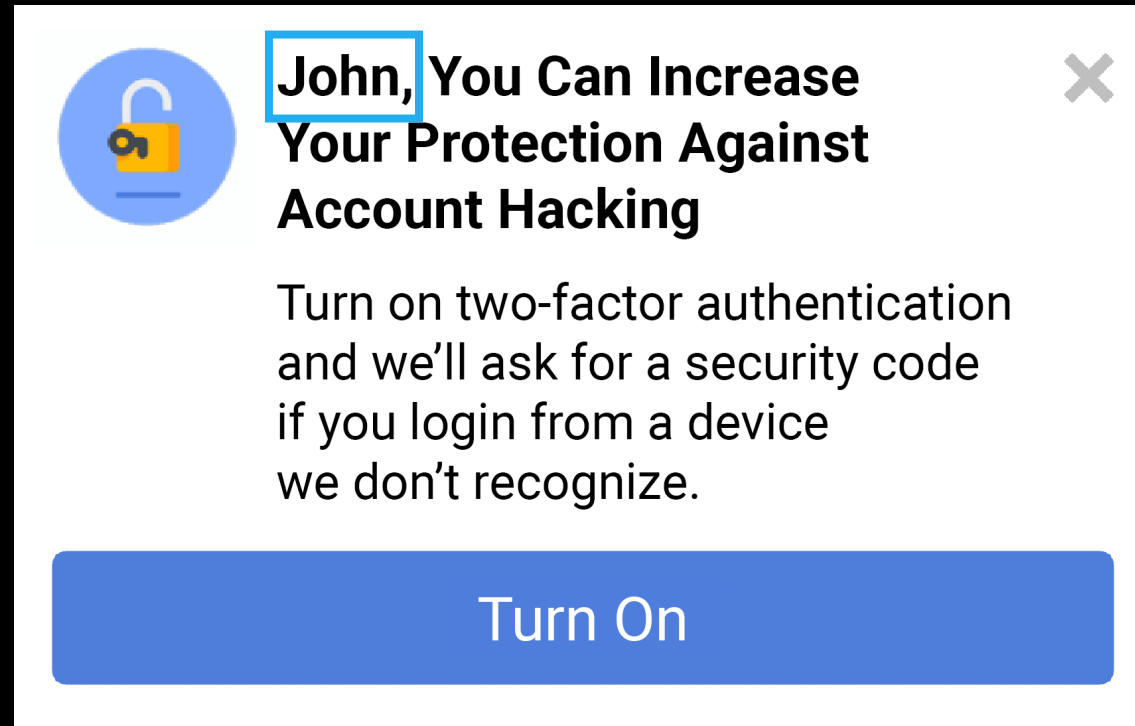

improve 2FA adoption?

RQ2: Does applying UX design patterns from other domains work for adoption of 2FA?

# Our first experiment tests personalizing the prompt with the user's name

#1

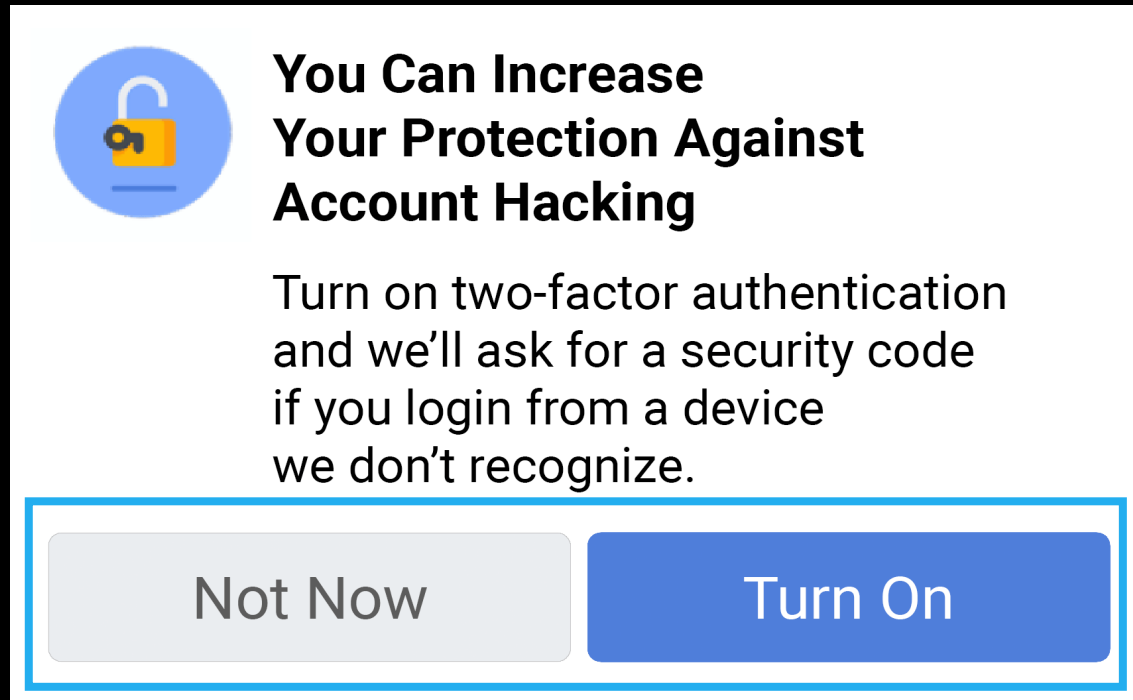

**Personalization**

From marketing &  
public policy research:  
Haynes et al. 2012  
Sahni et al. 2016

# Our second experiment tests a combination of reminder messaging & opinionated design

#2

**Opinionated Reminders**

Reminder Messaging:  
Frick et al. 2019

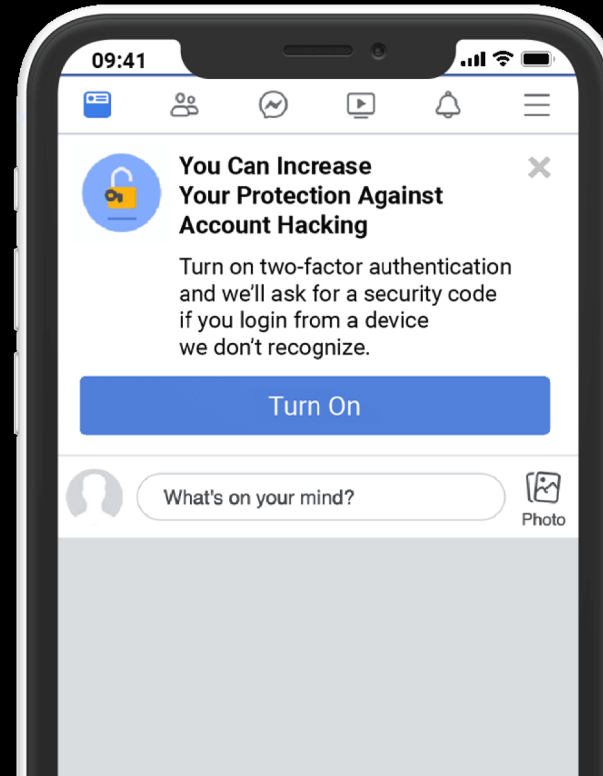

Opinionated Design:  
Felt et al. 2015  
Gray et al. 2018  
Chromik et al. 2019

# Our third experiment tests the impact of an interstitial (blocking) prompt

#3

Interstitial

Control

Effective:

Felt et al. 2014

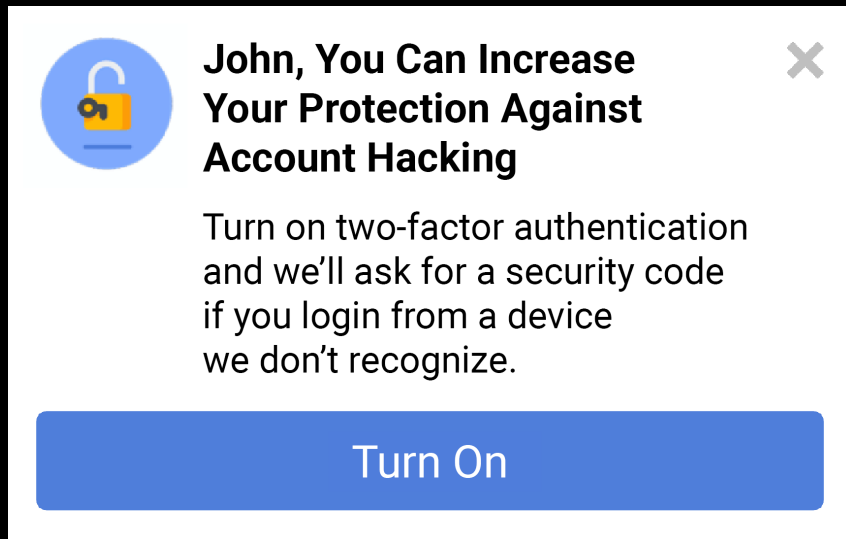

Kaiser et al. 2021

But not preferred by users:

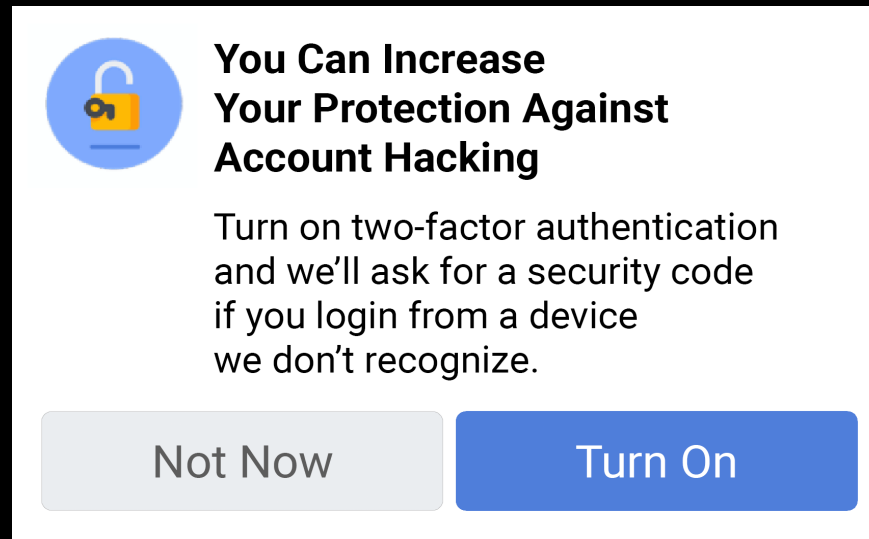

Brajnik & Gabrielli. 2010

Stanton et al. 2016

# Our second set of experiments addresses RQ2 by testing three UX techniques from other domains

Personalization

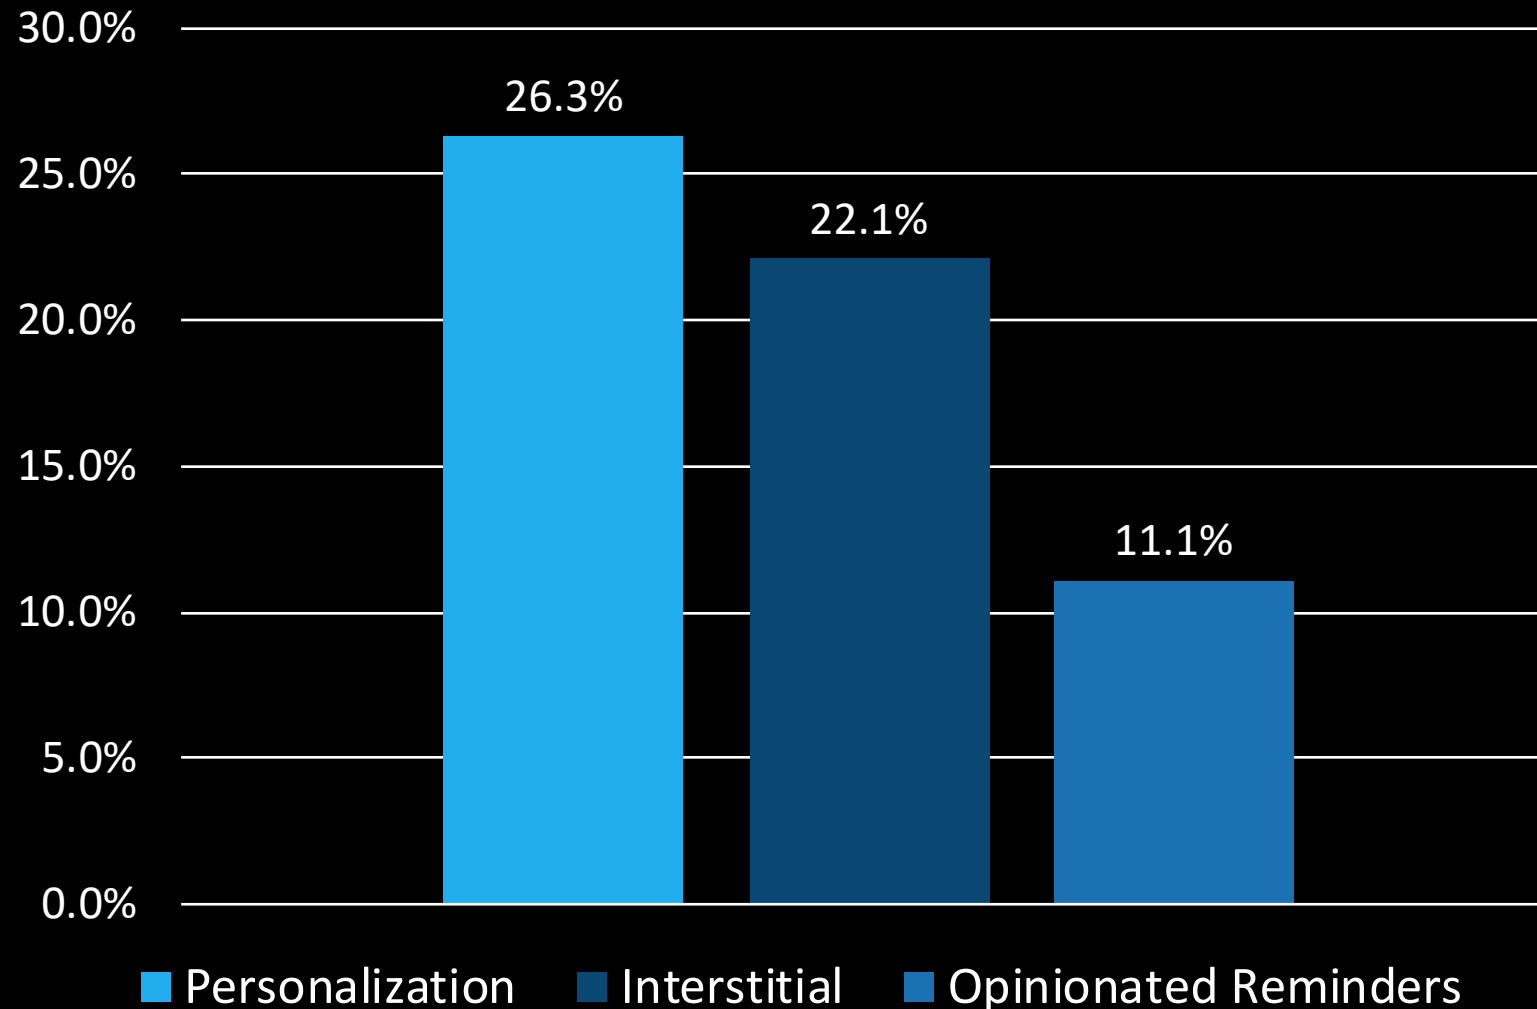

Opinionated Reminders

Interstitial

# All three UX experimental designs significantly improved CTE

# Participants who enabled kept 2FA enabled

95%

participants kept 2FA enabled after 90 days

**8% higher retention in prompted participants**  
vs. unprompted population

# Lessons learned: 2FA adoption field experiments
