

POLYCRUISE: A Cross-Language Dynamic Information Flow Analysis

Wen Li^{*}, Jiang Ming⁺, Xiapu Luo[×], Haipeng Cai^{*}

^{*}Washington State University

⁺University of Texas at Arlington

[×] The Hong Kong Polytechnic University

• Interfacing mechanisms between languages

- Uniform mechanism
 - **inter-process communication** (IPC)
e.g., Remote Procedure Call (RPC) on socket,
shared memory
- Language-specific mechanism
 - **foreign function interface** (FFI)
e.g., JNI for Java-C, Python extension for
Python-C

• Cross-language DIFA

- DIFA cross language boundaries

• Challenges in DIFA for multi-language program (MLP)

- Semantics disparity
 - Existing DIFAs → stopped at language boundaries
 - Stitching single-language DIFAs → not applicable
- Analysis cost-effectiveness
 - No instrumentation guidance for MLP
 - More complicated than SLP

• POLYCRUISE's targets

- unified instrumentation guidance
- scalable DIFA
- online bug detection

Pb.py	Cb.so
<pre> p1 from Cb import * p2 def Source (): p3 String S = source (); p4 Foo (S) P5 p6 def Foo (S) : p7 Cfoo (S) P8 p9 def Bar (S) : p10 Cbar (S) </pre>	<pre> c1 void Cfoo (pyObj, args) { c2 PyArg_ParseTuple(args, S) c3 c4 args2 = Py_BuildValue(S); c5 PyObject_Call(Bar, args2 , ...); c6 c7 } c8 void Cbar (env, obj, S) { c9 sink(S); c10 } </pre>

Example 1:

Sensitive data leaks on
bidirectional invocations cross
language units

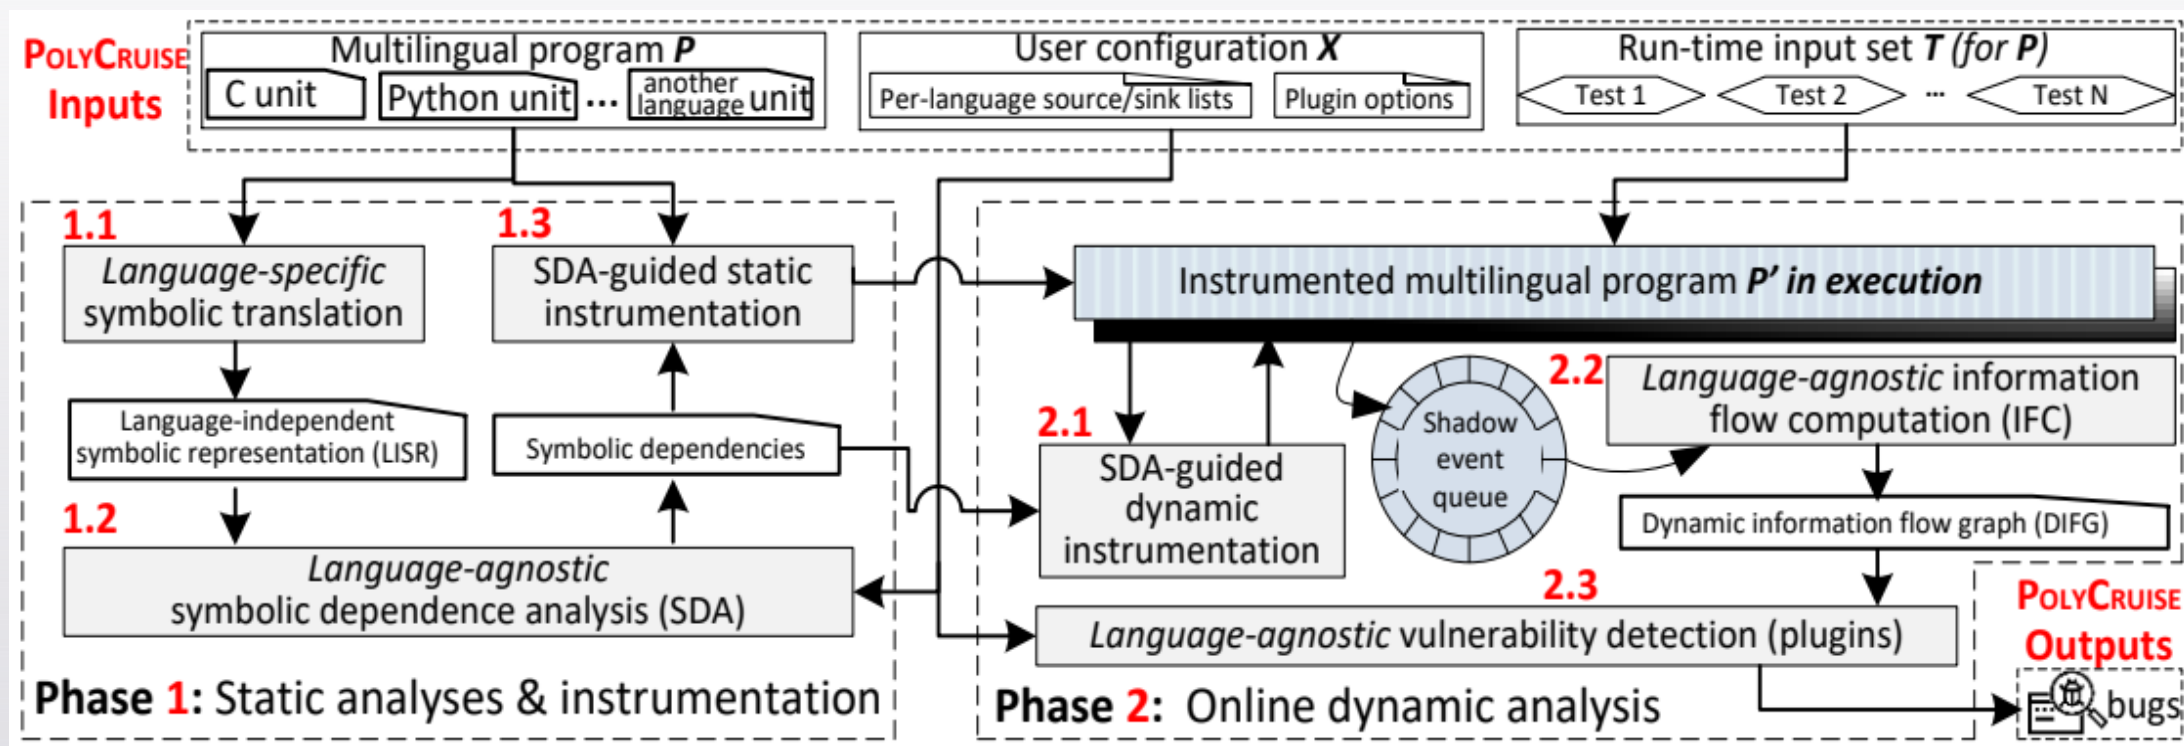

Pc.py	Cc.so
<pre> p1 from Cc import * p2 class PC: p3 def __init__(self, data): p4 self.data = data p5 def __enter__(self): p6 self.data = encode (self.data) p7 def __exit__(self, *_): p8 self.data = decode (self.data) p9 with PC (data): p10 process () </pre>	<pre> c1 PyObject* encode(..., data) { c2 en = base64 (data); c3 log (en) c4 return Py_BuildValue(en); c5 } c6 PyObject* decode(..., data) { c7 de = debase64 (data); c8 log (de) c9 return Py_BuildValue(de); c10 } </pre>

Example 2:

Sensitive data leaks on implicit
invocations cross language
units

• POLYCRUISE Workflow

static analysis & instrumentation → online dynamic analysis → bug detection on DIFA

• Static analysis & Instrumentation

- Efficiency? Only instrument necessary points (slicing)
- How to obtain **unified instrumentation** guidance for different language units?

→ Traditional data flow analysis? **×**

- **Single-language feasibility**: stop at language boundaries
- **Heavy**: memory usage & time cost
- **Consistency issue**

→ Symbolic Dependence Analysis (SDA) **✓**

- **Light weight** & **extensibility to new languages**
- **Steps**: **LISR translation** → **SDA on LISR** → **Instrumentation guidance**

● Symbolic Dependence Analysis (SDA)

1	Source Code	LISR	symbolic def-use pairs
2	typeA gValue	gValue	
3	Output(typeB& arg)	Output(arg)	
4	print (arg)	print(arg)	D[4]={ },U[4]={ arg }
5			
6	typeB Foo(typeB N)	T Foo(N)	
7	typeB V := 1	V = C	D[7] = {V},U[7] = {C}
8	typeB& S := V	S = V	D[8] = {S},U[8] = {V}
9	V := N	V = N	D[9] = {V},U[9] = {N}
10	while N != 0:	N	D[10]={ },U[10]={N}
11	V := V * N	V = V,N	D[11]={V},U[11]={V,N}
12	N := N - 1	N = N,C	D[12]={N},U[12]={N,C}
13	Output (S)	Output(S)	D[13]={ },U[13]={ S }
14	return S	return S	D[14]={ },U[14]={ S }

<1> Source \rightarrow (S9, V)

<2> forward(true flow dependencies) $\rightarrow D(S9) \cap U(S11) \neq \emptyset$

<3> backward (anti-dependencies) $\rightarrow U(S8) \cap D(S9) \neq \emptyset$

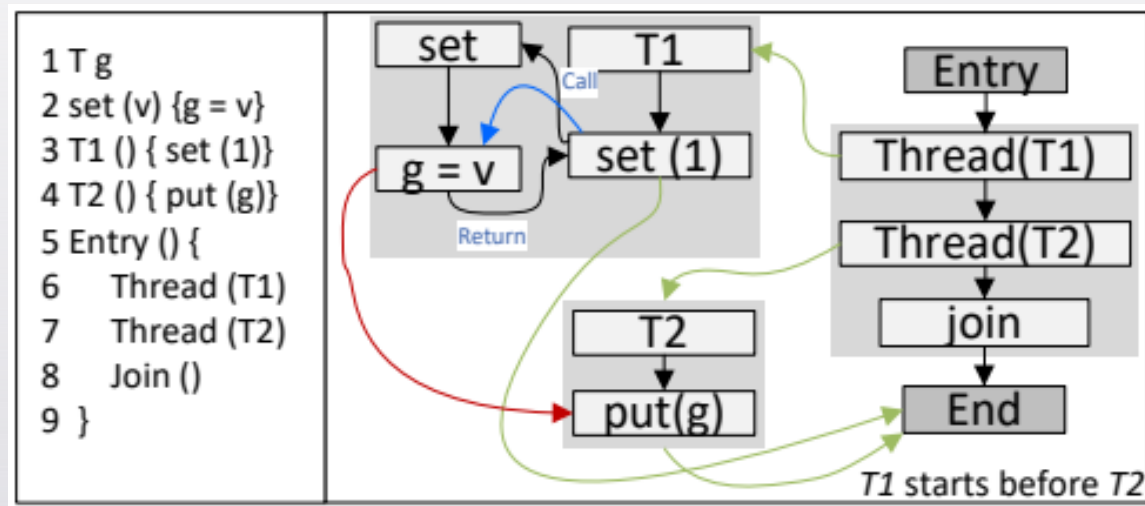

Hence, the symbolic dependence set of S9 $\rightarrow \{S8, S11\}$.

• Online dynamic analysis

- Language-agnostic
- Accumulated

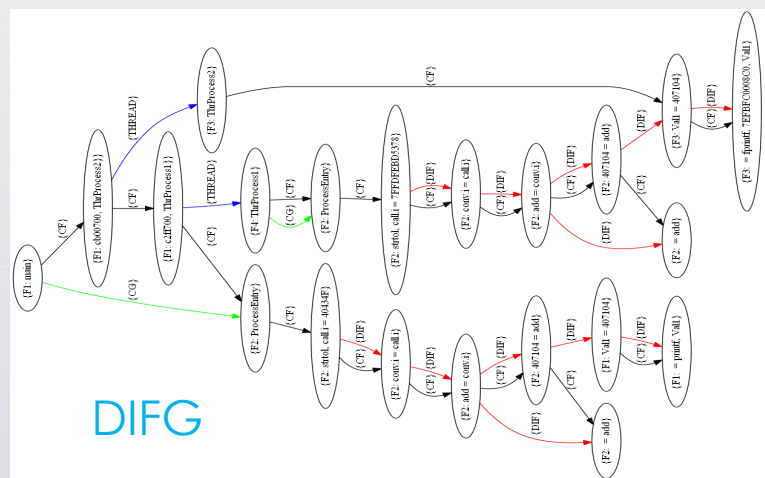

• Dynamic information flow graph (DIFG)

- Interthread control flow edge
- Intra-thread control flow edge
- Interthread data flow edge
- Intra-thread data flow edge

• Bug detection

• Three evaluation metrics

- **Effectiveness**

- PyCBench: 46 micro benchmarks for Python-C

- **Efficiency**

- Efficiency of SDA on 12 real-world Python-C programs

- Run-time slowdown and memory usage on 12 real-world Python-C programs

- **Capacity of bug discovery on real-world programs**

• Environment

Ubuntu 18.04 workstation with an Intel i7-10875H CPU and 16GB RAM

• Effectiveness results of POLYCRUISE on PyCBench

Group	#Inter-language path	#intra-language path	#false-negative	#false-positive
General flow	10	4	0	0
Global flow	9	0	0	0
Field sensitivity	8	0	0	2
Object sensitivity	9	2	0	1
Dynamic invocation	4	0	0	0
Summary	40	6	0	3

POLYCRUISE achieved 93.5% precision and 100% recall on PyCBench

• SDA on 12 real-world Python-C programs

Benchmark	Size (KLoC)	Time (second)	Memory (MB)	Instruction rate%
Bounter	3.5	0.02	2.97	52%
Immutableables	5.9	0.04	4.68	50%
Simplejson	6.4	0.03	4.47	56%
Japronto	9.4	0.02	3.89	47%
Pygit2	17.0	0.13	14.54	43%
Psycopg2	27.5	0.14	15.32	57%
Cvxopt	56.0	1.21	35.52	52%
Pygame	207.0	2.27	85.32	44%
PyTables	219.8	2.45	101.11	51%
Pyo	259.1	20.21	258.73	62%
NumPy	919.7	10.99	557.95	48%
PyTorch	6,419.2	175.19	7,414.95	51%

• Run-time slowdown and memory usage

Compared to whole-system instrumentation version:

→ **Slowdown**: the SDA improved the reduction of slowdown factor from 18.3% (in Japronto) to 66.2% (in PyTorch)

→ **Peak memory**: the SDA reduced the memory usage by 16.2% (in Japronto) to 67.1% (in Cvxopt)

• Bug Discovery by POLYCRUISE

Benchmark	#Integer-overflow	#Buffer-overflow	#Incomplete-comparison	#CVE
Bounter	0	1	0	1
Immutableables	0	1	0	0
Japronto	0	1	0	0
Cvxopt	0	0	4	1
Pyo	0	2	0	2
Numpy	1	3	1	4
Summary	1	8	5	8

• Extensibility to support other languages

- LISR translator
- Instrumentor

• Limitations

- Field-insensitive implementation
- Failed to cover implicit data flows
- Capability of bug discovery limited by test inputs
- Support language interfacing: FFI

- **POLYCRUISE, a novel dynamic information flow analysis (DIFA) for multilingual systems.**
 - SDA-guided instrumentation
 - Online DIFA
 - Bug detection plug-ins
- **14 bugs on 6 real-world Python-C programs, 8 CVEs assigned**
